## STV Series Balancing Valves

#### Applications/ Features:

Ordering

Information:

Danfoss STV series of balancing valves provide testing and balancing of circuit flow for hydronic heating or cooling systems.

STV valves provide a high level of balancing accuracy using an easy to set multi-turn setting wheel and memory lock.

#### Features:

- Positive shut-off
- Built-in memory stop
- Multi-turn 360 hand wheel with vernier scale and digit readout
- Offset pressure/ temperature ports
- Presetting and locking with Allen key

#### System Layout:

## STV Series Balancing Valves

Installation:

Install the balancing valve with the arrow on the valve's body pointing in the direction of the flow in the system.

To ensure an accurate reading, a straight length of 5 times the diameter of the pipe should be piped prior to the valve and a straight length of at least 2 times the pipe diameter should be piped after the valve.

If a pump is installed near the valve, a straight length of 10 times the diameter of the pipe should be piped prior to the valve to reduce an inaccurate measurement due to turbulence.

# Setting Flow Coefficient values

(Cv value = gpm@1psi ΔP):

Based upon the flow or differential pressures required within the system, the flow can be determined by using the equation:

$$Q = C_{\mathcal{V}} \cdot \sqrt{\Delta p}$$

 $\begin{array}{l} Q &= \mbox{flow} \\ C_{\mathcal{V}} = \mbox{flow coefficient} \\ \Delta p = \mbox{differential pressure} \end{array}$ 

For correction of fluids other than water, the following equation applies provided the viscosity of the fluid is the same for water, which is the case for most glycol and brine solutions:

$$Q_{\rm R} = \frac{Q_{\rm M}}{\sqrt{\delta}}$$

 $Q_{\rm R}$  = real flow

 $Q_{\rm M}$  = measured flow

 $\delta$  = specific density of fluid

**Flow Rate Graphs:** 

## STV Series Balancing Valves

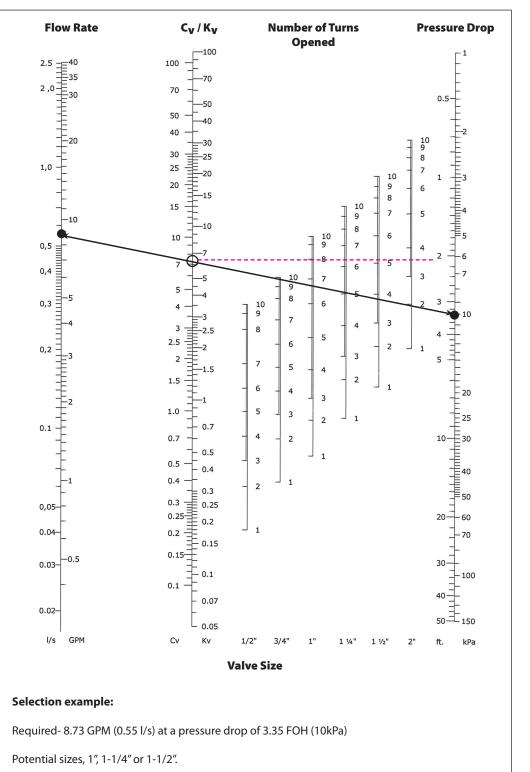

#### STV/STVL Balancing Valves 1/2" - 2"

1 foot of head (FOH) = 0.434 psi

- Plot the required flow rate and pressure drop within the columns and then draw a line between these plotted points.
- 2. Draw an additional horizontal line from the intersection of the Cv column across the valve sizes.
- 3. Based upon the intersection of the horizontal line with the valves sizes, select the appropriate sized valve.

In selecting the valve, a margin of allowance for adjustment should be considered if during commissioning the pressure drop is lower than designed. This reduced pressure drop may result in an undersized valve.

The selection of a valve that has a pre-set value above 3 turns offers better accuracy when setting.

**Flow Rate Graphs:** 

## STV Series Balancing Valves

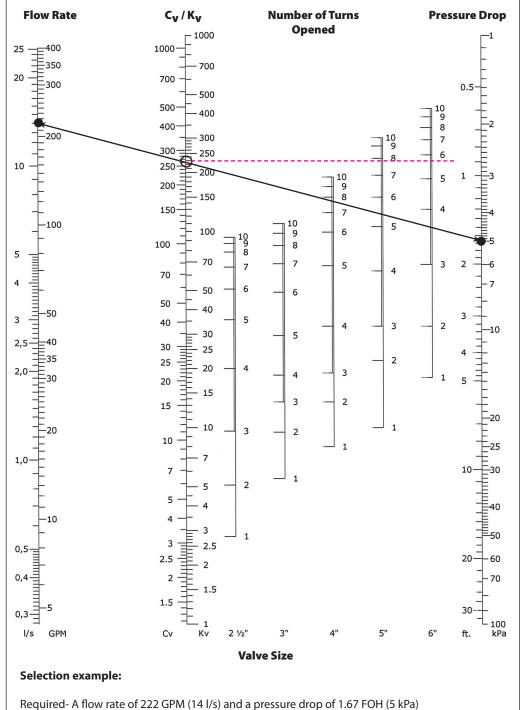

#### STVA Balancing Valves 2-1/2" - 6"

1 foot of head (FOH) = 0.434 psi

- Plot the required flow rate and pressure drop within the columns and then draw a line between these plotted points.
- 2. Draw an additional horizontal line from the intersection of the Cv column across the valve sizes.
- 3. Based upon the intersection of the horizontal line with the valves sizes, select the appropriate sized valve.

In selecting the valve, a margin of allowance for adjustment should be considered if during commissioning the pressure drop is lower than designed. This reduced pressure drop may result in an undersized valve.

The selection of a valve that has a pre-set value above 3 turns offers better accuracy when setting.

The required balancing valve for this application is a 5" with a setting of 7.8 turns or a 6" with a setting of 5.8 resulting in a Cv of 263 (Kv=225).

## STV Series Balancing Valves

#### Flow Rate Graphs:

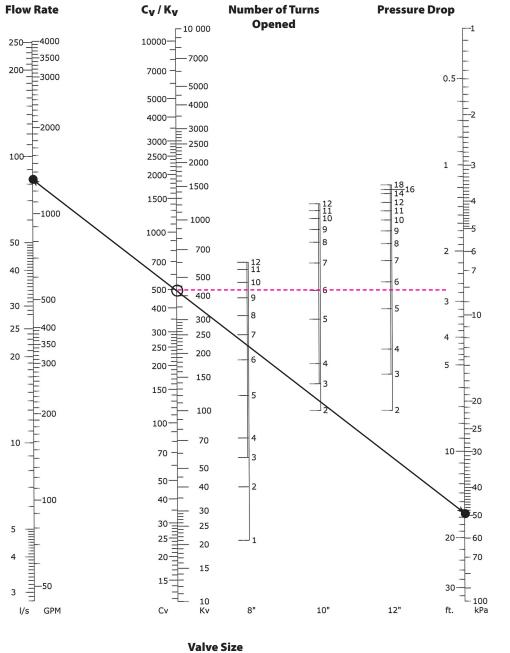

#### STVA Balancing Valves 8" - 12"

1 foot of head (FOH) = 0.434 psi

- 1. Plot the required flow rate and pressure drop within the columns and then draw a line between these plotted points.
- 2. Draw an additional horizontal line from the intersection of the Cv column across the valve sizes.
- 3. Based upon the intersection of the horizontal line with the valves sizes, select the appropriate sized valve.

In selecting the valve, a margin of allowance for adjustment should be considered if during commissioning the pressure drop is lower than designed. This reduced pressure drop may result in an undersized valve.

The selection of a valve that has a pre-set value above 3 turns offers better accuracy when setting.

#### Selection example:

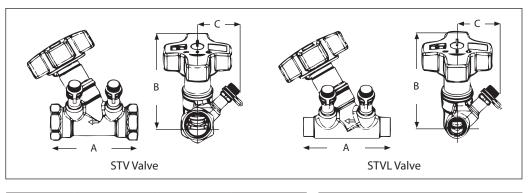

Required- A flow rate of 1,316 GPM (83 l/s) and a pressure drop of 16.73 FOH (50 kPa)

The balancing valve for this application could be an 8" valve set for 9.5 turns, a 10" valve set for 6 turns or a 12" valve set for 5.8 turns resulting in a Cv of 502 (Kv=430).

## STV Series Balancing Valves

#### **Typical specification:**

The balancing valve shall be of a brass construction and have female national pipe thread (NPT) or female solder connections. The valve shall be suitable for heating or cooling closed loop circuits. The balancing valve shall be capable of positive shut off and have P/T plug connections for testing. The valve adjustment shall be done via hand wheel hand wheel with digit readout within the handle of the valve. The balancing valve shall a hidden memory feature stop to prevent unauthorized adjustment and to ensure a return to the preset position. The memory stop within the valve shall be set via inner stem of the valve to prevent tampering. The valve shall be an STV series balancing valve.
